1 INTRODUCTION

A high quality and comparable laboratory standard in all countries is indispensable for a European-wide survey of the state of forests, small changes in nature should be detected and not the changes in laboratory quality. Important steps on this way are method harmonisation, QA/QC in the laboratories in daily routine and an implementation of a regular performed Interlaboratory Comparison Tests programme.

This Needle/Leaf Interlaboratory Comparison Test programme starts with the first European Foliar-Interlaboratory Comparison Test on two certified standards (BCR 100-*beech leaves* and BCR 101 - *spruce needles*) in 1993. The data were submitted by post or fax and had to be rechecked from the laboratories. All the data collection and evaluation must be done manually. The final report was available after some month. The Interlaboratory Comparison Tests were performed biannually till 2002.

Beginning with 2003/2004 (6th Interlaboratory Comparison Test) an annual test program was set up and the test were performed from the Forest Foliar Co-ordinating Centre/Austria (FFCC). The data collection was done via internet. The Needle/Leaf Interlaboratory Comparison Test program was opened for every interested laboratory.

Beginning in 2012 an internet based web interface was used for the data collection, to collect the billing information for the participation fee, for the data evaluation and for the creation of online qualification reports. The interface offers the possibility for first data checks (decimal errors, non plausible results, max LOQ) immediately before the final evaluation. The results of the ringtest are available now within some days, so the laboratories can react - in case of unsatisfactory results – very fast. For this case a re-qualification procedure was set up, starting with the 11th Test in 2009 (see: <http://bfw.ac.at/rz/bfwcms2.web?dok=7830>). This feedback procedure is mandatory for all *ICP-Forests laboratories* and showed very a positive effect on the data quality.

To support the participating laboratories and to exchange knowledge between them regularly meetings of the heads of the laboratories are organized from the ICP-Forests Working Group on quality assurance and quality control in laboratories. Leaf and needle reference materials for method validation and method verification are offered by FFCC (see: <http://bfw.ac.at/rz/bfwcms2.web?dok=5146>).

Today this interlaboratory test program is open for every laboratory and is financed by participation fee, by advertising, by selling reference materials and by ringtest sample collection and/or sample preparation from participating laboratories.

2 TASK, MATERIAL, PARTICIPANTS AND EVALUATION

2.1 Task

The Forest Foliar Co-ordinating Centre established the following timetable:

- Informing the participating labs (March 2015)
- Registration of 53 participants via internet (6th July 2015)
- Submission of the ring test samples (July 2015)
- Submission of the results from the labs (October-December 2015)
- Deadline of data input (1st January 2016)
- Evaluation according to DIN 38402/42 (January/February 2016)
- Submission of the final report and the online qualification reports (February 2016)
- Re-qualification process finished (1st August 2016)

The mandatory parameters S, N, P, Ca, Mg, K and C must be analysed from all *ICP-Forests laboratories*, optional parameters Zn, Mn, Fe, Cu, Pb, Cd and B can be analysed. A lot results for of other elements can be submitted. The units and all possible elements are shown in figure 1.

	Mandatory (for ICP-Forests labs)			Optional (for ICP-Forests labs)			Additional (with special interest for more labs)				Possible						

For each element four replicates per sample are necessary. Minimum sample weight for mandatory and optional elements should be per replicate 250 mg, because of the homogeneity of the sample material. All results must be calculated on dry weight (105°C). The used pretreatment method and the determination method must be specified by a code. This code was harmonized for all ringtests (foliage & litterfall, deposition & soil solution and soil) after the 4th Meeting of the Heads of the Laboratories in Zadar 2013.

For a deeper evaluation - all participant laboratories had to fill a questionnaire to get more information about the status of their quality control systems, about their instrumentation, about their sample number/year and about their methodical knowledge. *ICP-Forests laboratories* had to mark all parameters if the plan to analyse and submit monitoring results to ICP-FORESTS PCC from the growing season 2015.

2.2 Material

In July 2015 the Austrian Federal Research Centre for Forests, Natural Hazards and Landscape (BFW) sent out four dried and powdered plant samples to 53 laboratories in 25 countries.

The samples consisted of:

1. Beech Leaves - *Fagus sylvatica* (Austria)
2. Pine branches - *Litterfall* (Finland) - same sample like in the 11th Test (Sample 1) and 14th Test (Sample 3)
3. Spruce needles (Germany) - same sample like in the 9th Test (Sample 1)
4. Spruce Needles (France)

Sample 1 was collected from Reinhard Hagen and his employees in Lower Austria. **Sample 2** was collected from John Derome in Finland. **Sample 3** was collected from Günther Kießling in Germany and **Sample 4** was collected from Mireille Barbaste in France. Special thank to all colleagues for collecting and preparing samples for this ringtest.

The further sample preparation (drying and grinding) – if necessary - was done in the BFW laboratory for air pollution monitoring and plant analyses. Before the samples were sent out they were once more homogenized and filled in PE-bags. Homogeneity was tested for these samples by analysing the P, K, Ca, Mg, Fe, Mn, Zn, Cu and B content in eight randomly selected sub samples. No significant variation (Kruskal-Wallis Test - 95% significance level) could be found between the results of these eight sub samples, and they were therefore considered to be homogeneous.

2.3 Participants

Table 1 shows the number of countries and laboratories taking part in the interlaboratory comparison test program.

Table 1: Number of countries and laboratories taking part in the interlaboratory comparison test program

Interlaboratory Comparison Test	Year	Number of countries	Number of laboratories
1 st	1993/94	21	24
2 nd	1995/96	25	39
3 rd	1997/98	29	51
4 th	1999/00	29	52
5 th	2001/02	29	53
6 th	2003/04	26	46
7 th	2004/05	23	43
8 th	2005/06	30	52
9 th	2006/07	28	53
10 th	2007/08	29	54
11 th	2008/09	28	56
12 th	2009/10	30	56
13 th	2010/11	29	60
14 th	2011/12	28	62
15 th	2012/13	28	61
16 th	2013/14	25	57
17 th	2014/15	25	54
18 th	2015/16	25	53

Seven of the participating laboratories don't send any results till end of the deadline (A47, A84, A85, A86, A87, F06 and F11). With a few exceptions, all other laboratories analysed in the 18th Interlaboratory Comparison Test the complete list of mandatory elements and most of the optional elements (s. Table 2).

Table 2: Analysed elements from the participant laboratories (green); no results were submitted (grey); red “X”: monitoring samples will be analyzed from the growing season 2015 and these results will be sent to PCC in 2016 (“ICP-Forests laboratory”)

[illegible]

2.4 Data Evaluation

Only four replicates above the quantification limits can be used for calculating the an outlier free laboratory mean value. Results below the quantification limit are marked with "<" followed by the quantification limit of the laboratory (e.g. <0.1).

The results of the interlaboratory comparison test were evaluated according to DIN 38402/42. This method identifies three types of outliers. With the Grubbs-test the four replicates from each laboratory can first be checked for outliers (outlier type 1). The next step is to compare the recalculated mean values of each lab with the mean value from all labs as well as with the Grubb-test for outliers (type 2). Finally, the recalculated standard deviation from the laboratories must be compared with the total standard deviation (F-test) to eliminate laboratories with an excessive standard deviation (outlier type 3). Now the outlier free total mean value and the outlier free maximum and minimum mean value of all labs can be calculated. Marked outliers type 1 between the outlier free maximum and minimum mean values are not longer outliers, they will be included and will be used for the further evaluation of the interlaboratory comparison test. The last step is to calculate the outlier free statistical values.

With the outlier free mean value for each element/sample and the laboratory mean value the recovery must be calculated and compare with the tolerable limits from table 3. Laboratory results inside these tolerable limits are marked green (pass the test); outside they are marked orange (fail the test). This type of evaluation was fixed in the Foliar Expert Panel Meetings of As (1994) and Vienna (1997).

Table 3: Tolerable limits for normal concentration in foliage for the mandatory and optional elements

Element	Tolerable deviation from mean in %	Adopted by the Expert Panel Foliage and Litterfall
N	90-110	6 th Meeting - Bonn 1999
S	85-115	10 th Meeting - Madrid 2007
P	90-110	10 th Meeting - Madrid 2007
Ca	90-110	10 th Meeting - Madrid 2007
Mg	90-110	10 th Meeting - Madrid 2007
K	90-110	10 th Meeting - Madrid 2007
C	95-105	6 th Meeting - Bonn 1999
Zn	85-115	8 th Meeting - Prague 2003
Mn	85-115	8 th Meeting - Prague 2003
Fe	80-120	6 th Meeting - Bonn 1999
Cu	80-120	8 th Meeting - Prague 2003
Pb	70-130	6 th Meeting - Bonn 1999
Cd	70-130	6 th Meeting - Bonn 1999
B	80-120	6 th Meeting - Bonn 1999

Table 4: Tolerable limits for the mandatory and optional elements for samples with low concentrations (e.g. for non-foliage litterfall) the limits were fixed in Hamburg 2009 (11th Meeting of the Expert Panel Foliage and Litterfall)

Element	Tolerable deviation from mean in %	for concentrations below
N	85-115	5 mg/g
S	80-120	0.5 mg/g
P	85-115	0.5 mg/g
Ca	85-115	3 mg/g
Mg	85-115	0.5 mg/g
K	85-115	1 mg/kg
Zn	80-120	20 µg/g
Mn	80-120	20 µg/g
Fe	70-130	20 µg/g
Pb	60-140	0.5 µg/g
B	70-130	5 µg/g

If a limit of quantification (LOQ) is given from the laboratory, it will be checked first against the maximum acceptable LOQ from table 5. Is it higher than the maximum acceptable LOQ the lab will fail (marked in orange) - is it equal or lower it will be checked then against the outlier free mean. Is the submitted LOQ within the tolerable limits the lab will pass (marked in green), is it outside the lab will fail (marked in orange) for this parameter/sample combination. This evaluation of LOQ values was fixed in the 3rd Meeting of the Heads of the Laboratories in Arcachon (2011).

Table 5: Maximum acceptable limit of quantification and lowest evaluated interlaboratory sample result fixed in Arcachon 2011 (3rd Meeting of the Heads of the Laboratories)

Parameter	Unit	max. acceptable LOQ	Lowest evaluated result
N	mg/g	2	-
S	mg/g	0.3	-
P	mg/g	0.3	-
Ca	mg/g	0.5	-
Mg	mg/g	0.3	-
K	mg/g	0.5	-
C	g/100g	10	-
Zn	µg/g	5	-
Mn	µg/g	5	-
Fe	µg/g	5	-
Cu	µg/g	1	1
Pb	µg/g	0.50	0.20
Cd	ng/g	50	20
B	µg/g	1	-

In case of very low concentrations of copper, cadmium and lead in the interlaboratory comparison test samples these results will be excluded from the qualification report (see table 5). This procedure is needed to avoid wrong qualification results influenced by inaccurate results. On the other hand there is no practical need to detect these low concentrations in real samples, because it gives no additional information of the nutrient status ($< 1 \mu\text{g Cu/g}$ is always deficiency) or of the pollution impact situation ($< 20 \text{ ng Cd/g}$, $< 1 \mu\text{g Cu/g}$, $< 0.2 \mu\text{g Pb/g}$ is always not polluted).

Aufschluss von
40 Proben
gleichzeitig!

Einfacher als Kaffee kochen:

Mikrowellen-Aufschlüsse im neuen MARS 6

Einfachste Handhabung: Keine Kabel, kein Werkzeug
 Das Mikrowellen-Laborsystem MARS 6 ist für den vielseitigen Einsatz in der Elementanalytik entwickelt worden. Die neue Reaktionsbehälter-Technologie ermöglicht die Behältermontage in nur 15 Sekunden!

Typische Einsatzgebiete:

- Elektroschrott (RoHS/WEEE) - Kunststoffproben - Pflanzenproben - Tiergewebe - Abwasser - Fisch, Muscheln und maritime Proben - Sedimente, Boden und Schlamm	- Lebensmittel - Düngemittel - Nährstoffe - Filter - Blut, Haare, Serum und Urin - Mineralien und Erze - und viele mehr!
---	--

Das MARS 6 verfügt über neue berührungslose Sensortechnologien zur Druck- und Temperaturüberwachung in allen Behältern. Die Datenausgabe an einen Drucker sowie an einen externen PC ist ohne weiteres möglich.

Der besondere Clou: Die Aufschlussbehälter können in ICP-Autosamplern eingesetzt werden!

3 RESULTS

3.1 Main results of the questionnaire

All participating laboratories should fill a questionnaire in order to obtain information about the status and changes of their quality control systems. 51 of the 53 laboratories submit this questionnaire.

The first questions dealt with the accreditation status of the laboratories and the summarized results are shown in figure 2.

Figure 2: Accreditation status according EN 17025 (n=51)

41.2% of the laboratories are accredited now (19 labs) or plan an accreditation within 1-2 years (2 lab) - 23 laboratories don't plan an accreditation in future.

The next important question was about the usage of control charts for routine quality control. 94.1% of these 51 laboratories are using control charts, and most of them are using average control chart – 3 of this 51 laboratories are still using no control chart. Some of the laboratories are using more than one type of control charts.

The other questions dealt with analytical knowledge and number of samples per year they will be evaluated in the next test, because not all labs answer this questions at the moment.

Figure 3: Types of control charts used in foliar laboratories

3.2 Results of the 18th Interlaboratory Comparison Test

Table 6 gives an overview which laboratories analysed the test samples well and which laboratory encountered quality problems. This evaluation is based on the tolerable limits from table 3 and table 4 and on the maximum acceptable limit of quantification (LOQ) from table 5. A green marked field means all four samples are analysed well, a grey marked field means no results were sent from this laboratory till 1st of January 2016. The red marked “<” or “>” mean number of results lower or higher the tolerable limits.

If a LOQ is given from the laboratory, it will be first checked against the maximum acceptable LOQ from table 5. Is it higher than the maximum acceptable LOQ the lab will fail (marked with “L”).

The following participants, which have a lower percentage of correct results (lower than 80% of correct results), have bigger QC/QA-problems in their laboratory:

A79 (79.1%), **F24** (78.6%), **A89** (65.5%), **F21** (62.5%) and **A62** (45.0%).

Laboratory A80 (78.3%) has only special interest in heavy metals. This lab failed with all samples for zinc and with one sample for iron, but it hasn’t analysed a lot of mandatory and optional parameters. This fact was the reason for the “low percentage of correct results”.

Some results (especially for iron and copper) are within the tolerable limits, but the statistical evaluation shows an excessive standard deviation (outlier type 1 or 3), that means they had e.g. contamination influences or methodical problems. These results are marked with “a” or with “c” in the detailed evaluation in the annex.

Sample 2 (pine branches) was a difficult sample, because of the low concentrations of some elements. More than 40% of the *non tolerable* results are only from sample 2.

Table 6: Results of the 18th Interlaboratory Comparison Test – results marked with the limits from tables 3 and 4 (green = all samples were analysed well; < = too low; > = too high; grey = no results were sent) and with the maximum acceptable LOQ from table 5 (L = too high LOQ)

The lead concentration of sample 4 was too low for the evaluation.

3.3 Comparison between the 18th Interlaboratory Comparison Test and former tests

Sample 3 of the 18th and sample 1 of the 9th Interlaboratory Comparison Tests are identical (*Spruce needles* - Germany). For most of the elements the mean values harmonize well (see Table 8). The results are good comparable and the sample is stable.

Table 8: Comparison between the 9th and 18th Interlaboratory Comparison Test

Element (Unit)	9 th Interlaboratory Comparison Test 2006/07 (Sample 1)		18 th Interlaboratory Comparison Test 2015/16 (Sample 3)	
	Mean	Number of Labs	Mean	Number of Labs

Cd ng/g	180.2	28	184.9	28
B µg/g	12.72	21	12.49	21

The ringtest is evaluated on the basis of fixed limits (table 3 and 4). These tolerable deviations from the mean were updated in Foliage Expert Panel Meetings in Bonn (1999), Prague (2003), and Madrid (2007) and in the 1st Meeting of the Heads of the Laboratories in Hamburg (2009) for some elements. Maximum acceptable limit of quantification (table 5) defined in the 3rd Meeting of the Heads of the Laboratories in Arcachon (2011) are used from the 14th to 18th ringtest. The changes of the tolerable results from the 6th to the 18th test are shown in tables 9a and 9b.

Table 9a: Percentage of non tolerable results from 6th to 12th test

Sulfur & Carbon in Soil and Plants

The newest Generation of LECO SC Analyzers

- Revolutionary Cornerstone® technology
- Low drift with highest precision
- High throughput with 100 position autosampler
- Energy saving new heating elements - heat up the sample, not the laboratory!
- New IR cells with unmatched stability

3.4 Evaluation by element

3.4.1 Nitrogen

7.9 % of non-tolerable results - a good result - because most of these bad results are linked to the low nitrogen content of the sample 2 (pine branches). Only with this result of the pine branches sample 29.3 % of all participants failed. If you take out these litterfall sample results a continuous improvement compared with the last interlaboratory tests can be found (6.0 → 3.1 → 2.1 → 0.8 %).

No laboratory failed with three or four samples.

3.4.2 Sulphur

The laboratory A89 failed in analyzing three of the four samples. In comparison with the last Interlaboratory Comparison Tests the percentage of non-tolerable results is lower (14.8 → 9.9 → 6.4 %). The laboratory A89 is using an element analyzer – the determined sulphur content is too high. The reason for this could be a calibration error (e.g. wrong standard concentration).

3.4.3 Phosphorus

In comparison with the last Interlaboratory Comparison Tests the percentage of non-tolerable results is still high (18.8 → 14.7 → 15.5 %). Especially sample 2 with a low phosphorous content was problematically for a lot of laboratories (more than 26 % of non tolerable results). The laboratories A62 and F21 failed in analyzing three or all four samples. A re-qualification is needed for the *ICP-Forests laboratory A62*. This laboratory failed also in the last test for phosphorous! This lab is using a colorimetric phosphorous determination after an oxidizing digestion. The oxidizing agent can disturb the colorimetric phosphorous determination.

3.4.4 Calcium

In comparison with the last Interlaboratory Comparison Tests is the percentage of non-tolerable results better than before (16.3 → 17.7 → 9.1%). The laboratories A53 and A62 failed in analyzing three of the four samples. A re-qualification is needed for the *ICP-Forests laboratory A62*.

3.4.5 Magnesium

In comparison with the last tests the percentage of non-tolerable results is higher (8.8 → 12.3 → 14.2 %). Especially sample 2 with a low magnesium content was problematically for a lot of laboratories (more than 27 % of non tolerable results). The laboratories A62, A79 and F24 failed with three of the four samples. A re-qualification is needed for the *ICP-Forests laboratories A62 and F24*.

3.4.6 Potassium

In comparison with the last tests the percentage of non-tolerable results is higher (9.1 → 11.5 → 15.6 %), but most of the non-tolerable results are linked to the low potassium

content in sample 2 (more than 33 % of all labs failed). The laboratories A62, F21 and F27 failed in analyzing three of the four samples. Laboratory F21 failed also in the last test for potassium!

A re-qualification is needed for the *ICP-Forests laboratories* A62 and F27.

3.4.7 Carbon

The percentage of non tolerable results is similar than in the last Interlaboratory Comparison Test (10.0 → 7.8 → 9.5 %). The laboratories A59, F13 and F25 failed in analyzing all four samples. It seems that these laboratories have calibration problems with their element-analyzers. Laboratory A59 failed also in the last test for carbon! A re-qualification is needed for the *ICP-Forests laboratories* A59 and F13.

3.4.8 Zinc

13.5 % of the results were non-tolerable – the result is higher compared with the last tests (5.6 → 8.1 → 13.5 %). Four laboratories A56, A80, A82 and A89 failed in analyzing all four samples. It seems that the laboratories A56 and A82 have a contamination or a calibration problem with ICP-AES – all results are too high. The laboratories A80 and A89 are using an ICP-MS method a calibration error or a too high blank correction could explain the too low zinc content in the samples.

3.4.9 Manganese

6.1% of the results were non-tolerable. Not bad but there were only high concentrations in the samples (> 100 µg Mn/g). Only the laboratories A62 and A89 failed with all samples. All results were too low; a calibration error seems to be possible. A re-qualification is needed for the *ICP-Forests laboratory* A62.

3.4.10 Iron

In comparison with the last tests the percentage of non-tolerable results is higher (9.4 → 6.5 → 12.2 %). It looks not so dramatically but the results of sample 2 are really bad - close to 30% of non tolerable results for this high iron content (> 260 µg/g). Most of the laboratories which used a microwave digestion method observed a too low iron content. It seems that the used digestion time and/or the digestion temperature is/are too low and iron is still fixed in the silica matrix.

The laboratories A62 and F33 failed with three of the four samples. A re-qualification is needed for both *ICP-Forests laboratories*.

3.4.11 Copper

4.2% of the results were non-tolerable – a really good result. Only laboratory A56 failed in analyzing all samples; contamination could be a reason for the too high results.

Some laboratories (A49, F05, F15 and F27) have a higher variation in their copper results (outlier 1 or 3). Contamination effects or a methodical problem could be a reason for that.

3.4.12 Lead

For passing this Interlaboratory Test for lead two or three sample results must be within the tolerable limits. The *background* sample 4 (0.18 µg/g) was excluded from the evaluation.

In comparison with the last tests the percentage of non-tolerable results is much higher (10.7 → 7.8 → 16.0 %), because the lead concentrations of the samples 1 and 3 are low. The laboratories A65, A89, F12 and F33 failed with two samples. The laboratory A65 failed with lead in the last test too! A re-qualification is needed for the *ICP-Forests laboratories* F12 and F33.

3.4.13 Cadmium

In comparison with the last test the percentage of non-tolerable results is lower (14.3 → 8.0%). The laboratory A49 failed with all samples.

3.4.14 Boron

11.9 % of the results were non-tolerable. In comparison with the last test the percentage of non-tolerable results is higher (6.3 → 5.0 → 11.9%). One laboratory (F33) failed with three of the four samples. A re-qualification is needed for the *ICP-Forests laboratory* F33.

4 CONCLUSIONS

53 laboratories in 25 countries participated in the 17th Needle/Leaf Interlaboratory Test, but only 46 laboratories submit results in time.

A new system for qualification and re-qualification started with the 11th test in 2009. This system was enlarged after the manual update in 2010 to all ICP-Forests partners (see König et al. 2010, 2013, Rautio et al. 2010, 2013 Pitman et al. 2010). With the ring test report each participant get a qualification report, the download is possible on the webpage (http://bfw.ac.at/ws/ring_nadel.login). It has been decided to qualify the results of each parameter separately. If 50% or more (generally two, three or all four samples) of the results for this parameter for all the samples of the ring test are within the tolerable limits, the laboratory is qualified. Re-qualification is mandatory for all *ICP-Forests laboratories*, if monitoring results (foliage, litterfall, ground vegetation) will be submitted to PCC in autumn 2016 from the vegetation period 2015.

New since the 14th Interlaboratory Test is the usage of maximum acceptable limits of quantification (LOQ). These limits are needed, because a lot of laboratories are using multi element methods (mostly ICP-AES) with higher LOQs for some elements. But for evaluating and classification of the monitoring samples *real* measured results and lower LOQ are needed. A task was given from the 12th Expert Panel Meeting Foliage and Litterfall (Tallinn 2011) to the Working Group QA/QC in Laboratories to fix this problem. Maximum acceptable LOQs for mandatory and optional parameters for foliage, litterfall and ground vegetation were discussed and accepted in the 3rd Meeting of the Heads of the Laboratories (Arcachon 2011). This problem is more or less fixed now – only two laboratories submit higher LOQs than the maximum acceptable and failed for this sample/parameter.

In case of very low concentrations of copper, cadmium and lead in the interlaboratory comparison test samples, results of these samples will be excluded from the evaluation (this happened for the lead results of the sample 4). This procedure is needed to avoid wrong qualification results influenced by inaccurate measurements - and on the other hand there is no real need to detect these very low concentrations in real monitoring samples, because it gives no additional information of the nutrient status or of the pollution impact situation.

In general are the results of the 18th Needle/Leaf Interlaboratory Test similar than the test before. A lot of laboratories failed with the pine branch sample (sample 2) – more than 40% of all non-tolerable results are linked with this sample. This sample has a low content of nitrogen, sulphur, phosphorous, calcium, magnesium and potassium and a difficult matrix especially for a determination of the correct iron content.

The following participating laboratories with a lower percentage of correct results (less than 80%) have bigger QC/QA-problems in their laboratory and/or methodical problems:

A79 (79.1%), **F24** (78.6%), **A89** (65.5%), **F21** (62.5%) and **A62** (45.0%).

Some of the *ICP-Forests laboratories* failed and had to do a re-qualification for some parameters (**A59**: C; **A62**: P, Ca, Mg, K, Mn, Fe; **F12**: Pb; **F13**: C; **F24**: Mg; **F27**: K; **F33**: Fe, Pb, B). These (*ICP-Forests*) laboratories had to check and re-validate their method or select

another better method. If reference material is needed for this purpose - FFCC can offer some ringtest material (see: <http://bfw.ac.at/rz/bfwcms2.web?dok=5146>).

All laboratories are invited to take part in the re-qualification program, started up from now till 1st of September 2016 (see: <http://bfw.ac.at/rz/bfwcms2.web?dok=7830>).

Some words to the used analytical equipment. Microwave digestion method is getting more and more common. Too low iron content can be observed, if the digestion temperature and/or time is/are too low.

A clear methodical recommendation to ICP-AES can be given and, where ICP-AES is not sensitive enough, ICP-AES with ultrasonic nebulizer, ICP-MS should be used. For nitrogen and carbon, element analyzers are the best choice, if a correct calibration is performed.

5 OUTLOOK

More and more laboratories changed their method during the last years to microwave digestion and ICP-MS, so they are able now to determine heavy metals simultaneously with the mandatory and optional elements with a sufficient accuracy. Mercury can be detected easily with a good accuracy with a special element analyzer or by AAS cold vapor technique. Heavy metals are an important air pollution indicator also with special interest within ICP-FORESTS.

It is planned to evaluate the following additional elements according DIN 38402: As, Cr, Co, Hg and Ni in a second evaluation - these elements are analyzed at the moment from more than 10 participants. Maybe it is also possible to include the elements Mo, Tl and V in this evaluation up from the next test, if more laboratories can/will analyze them.

A special evaluation for aluminium and sodium are at the moment not planned. The results of aluminium scatter a lot, because most of the laboratories are not using HF acid for total digestion. The detected aluminium content depends on the digestion method (time, temperature, acid mixtures) and the sample matrix and the results are not comparable between the laboratories. Sodium results scattered also a lot, because of contamination effects.

Method Code – Pretreatment (P)

Extraction methods

PA06	Extraction with diluted HNO ₃
PA99	Other extraction method

Digestion methods (open system)

PB02	Open digestion with H ₂ SO ₄ /H ₂ O ₂
PB03	Open digestion with HNO ₃
PB04	Open digestion with HNO ₃ /H ₂ SO ₄
PB05	Open digestion with HNO ₃ /H ₂ O ₂
PB06	Open digestion with HNO ₃ /HClO ₄
PB07	Kjeldahl H ₂ SO ₄ with Se or Cu catalyst
PB08	Modified Kjeldahl H ₂ SO ₄ with Ti/Cu catalyst
PB99	Other digestion method (open system)

Pressure digestion methods

PC01	Pressure digestion HNO ₃
PC02	Pressure digestion HNO ₃ /H ₂ O ₂
PC03	Pressure digestion HNO ₃ /HF (total digestion)
PC99	Other pressure digestion method

Microwave pressure digestion methods

PD01	Microwave pressure digestion HNO ₃
PD02	Microwave pressure digestion HNO ₃ /H ₂ O ₂
PD03	Microwave pressure digestion HNO ₃ /H ₂ O ₂ /HCl
PD04	Microwave digestion HNO ₃ /HClO ₄
PD05	Microwave pressure digestion HNO ₃ /HF (total digestion)
PD99	Other microwave pressure digestion method

Dry ashing digestion methods

PE01	Oxygen ashing (Schöniger)
PE99	Other dry ashing method

Other methods

PZ01	Material melted and formed (tablet) for XRF methods
PZ02	Material pressed (pellet) for XRF methods
PZ98	No pretreatment
PZ99	Pretreatment method not in this list

Method Code – Determination (D)

Element analyzer

DA01	Macro Elemental-analyzers for C, N or S for solids (Sample > 100mg)
DA02	Micro Elemental-analyzers for C, N or S for solids (Sample ≤ 100mg) with an extra milling step
DA05	Hg-Analyzer
DA99	Other Element analyzers method

Atomic Absorption or Emission Spectroscopy

DB01	AAS-flame technique (C ₂ H ₂ /Air)
DB02	AAS-flame technique (C ₂ H ₂ /N ₂ O)
DB03	AAS-cold vapor technique
DB04	AAS-hydride technique
DB05	AAS-flameless (electrothermal technique)
DB06	AES-Flame technique (Flame photometry)
DB07	AFS-hydride-technique
DB08	ICP-AES without Ultrasonic nebulisation
DB09	ICP-AES with Ultrasonic nebulisation
DB10	ICP-MS
DB99	Other Atomic Absorption or Emission Spectroscopy method

Physical techniques

DD01	X-ray-energy dispersive
DD02	X-ray-wavelength dispersive
DD99	Other physical technique

UV-VIS Spectrophotometry techniques

DE01	UV-VIS-spectrophotometry-techniques
DE03	Continuous flow UV-VIS-spectrophotometry-techniques
DE05	Flow injection UV-VIS-spectrophotometry-techniques
DE99	Other UV-VIS Spectrophotometry technique

Electrochemical methods

DF03	Ion selective electrodes (except pH-Electrodes)
DF08	Other Potentiometric titration
DF99	Other Electrochemical method

Other methods

DZ02	N-Determination (after Kjeldahl digestion)
DZ99	Detection method not in this list

List of abbreviation

No.	Number of result ordered by Lab. mean
Lab. Code	Code of the laboratory / Laboratory which are analysing level II samples are marked with x
P	Code for pre-treatment method (s. method code pre-treatment)
D	Code for determination method (s. method code determination)
Lab. mean	Mean of the results of each laboratory without outliers type 1
n	Number of all results from this laboratories without outliers type 1, 2, 3
N	Number of all results from all laboratories without outliers type 1, 2, 3
L	Number of all laboratories without outliers type 2, 3
Mean	Total mean value from all results without outliers type 1, 2, 3
Si	Standard deviation from each laboratory without outliers type 1
SI	Mean Standard deviation for all laboratories without outliers type 1, 2, 3
Vi	$Si \cdot 100 / \text{Lab. mean}$
VI	$SI \cdot 100 / \text{Mean}$
SR	Standard deviation from all results without outliers
VR	$SR \cdot 100 / \text{Mean}$
Recovery %	$\text{Lab. mean} \cdot 100 / \text{Mean}$
a	Outlier type 1
b	Outlier type 2
c	Outlier type 3
*	Not tolerable mean value from one laboratory (see tables 3 & 4)
**	Higher than maximum acceptable limit of quantification (see table 5)

Annex - Results

Mandatory parameters (N, S, P, Ca, Mg, K, C)

Optional parameters (Zn, Mn, Fe, Cu, Pb, Cd, B)

Additional parameters

18th Needle/Leaf Interlaboratory Comparison Test 2015/2016

Element: N

Sample: 1

Unit: mg/g

No.	Lab. Code	Method code		Replications				n	Lab.mean	Lab.standard dev.		Recovery %
